

## **NAWNPEM version 1.08 (date 12-01-2002)**

### Modifications (version 1.07):

1. Modifications for compatibility with version MW\Pharm 3.30 and 3.40.
2. Automatic conversion of iv bolus to infusion  
Earlier versions (up to 1.05) did not handle an iv bolus correctly. Since NPEM does not support the use of an iv bolus, an iv bolus is now converted to a short infusion with a duration equal to the user-defined minimum (see #3).
3. User-defined minimum duration of infusion  
IV bolus administrations (see #2) are converted to a short infusion with a user-defined duration. Similarly, infusion administrations with a duration shorter than this user-defined minimum are also converted.
4. Correction of formula Jelliffe II for females.  
See #2.11 of the release notes of MW\Pharm version 3.40.
5. The patient's age is now calculated at the start of the medication, both for patient selection criteria and for the calculation of creatinine clearance. In earlier versions (up to 1.06) the age was determined by the actual (computer) date.  
See also #1.7 of the release notes of MW\Pharm version 3.40.

### Corrections (version 1.08)

6. Correction of error in version 1.07 with respect to age of children < 1 year. In some case these children were not included in the selection. This error in version 1.07 (not in earlier versions) has been corrected.
